

# Setting up for access over the Internet

## Note

You must follow the local network access set up page ([Setting up for access on a local network](#)) before setting up access from the Internet.

## Warning

Running the uTorrent Web UI from a computer that is using a non-fixed Internet connection (e.g. 3G USB devices, Sierra Wireless, other mobile based Internet, etc) **is not supported on a local network, nor is it supported over the Internet**. Normal WiFi (802.11) that connects back to a fixed (e.g. fiber, DSL or cable) Internet connection will work without any trouble. If you do not have a fixed Internet connection on the computer the uTorrent desktop program is running, you cannot use the Web UI, and thus you cannot use this **Torrent Remote app**.

Connecting to your uTorrent with the **Torrent Remote app** over the Internet is a little bit more involved than only accessing it from a local area network (LAN), however the following two pages will help you to configure your devices for Internet access.

- [Opening or forwarding ports on your router](#)
- [Setting up a Dynamic DNS Service](#)
